

**IN THE CLAIMS**

Please amend the claims as follows.

1. (Previously Presented) A display system comprising a display device having:  
window means for displaying information in at least two windows of said display device,  
parameter control means for controlling a parameter of a respective one of said windows in  
response to a user supplied parameter control command,  
user operable window selection means for selecting a window to be controlled by said  
parameter control means,  
at least two remote controls, and  
association means for associating a respective remote control with a respective window,  
wherein the window selection means are adapted to select the window in response to a  
parameter control command received from a remote control associated with the selected window, the  
parameter control command comprising window identification information.

2. (Original) A display system as claimed in claim 1, the display device being  
capable of receiving information from different sources and displaying the information from each of  
said sources in a respective window, said parameter being the source of the information displayed in  
said respective window.

3. (Original) A display system as claimed in claim 1, said association means comprising, in each respective remote control, window identification means for transmitting, along with a transmitted parameter control command, a signal indicative of a window associated with the respective remote control.

4. (Original) A display system as claimed in claim 1, said association means comprising discrimination means for discriminating signals received from said at least two remote controls so as to determine from which remote control the received signals originate.

5. (Original) A display system as claimed in claim 4, said at least two remote controls being arranged to transmit signals in accordance with different protocols, the discrimination means being arranged to recognize said different protocols.

6. (Original) A display system as claimed in claim 4, said association means comprising, in each respective remote control, remote control identification means for transmitting, along with a transmitted parameter control command, a signal identifying the respective remote control.

7. (Original) A display system as claimed in claim 1, the window selection means being arranged to bypass said association means when only one window is displayed on the display device.

8. (Previously Presented) A display device for use in a display system, comprising:

window means for displaying information in at least two windows in a display screen,

parameter control means for controlling a parameter of a respective one of said windows in response to a user supplied parameter control command,

user operable window selection means for selecting a window in the display screen to be controlled by said parameter control means, and

association means for associating a respective one of at least two remote controls with a respective window,

wherein the window selection means are adapted to select the window in response to a parameter control command received from a remote control associated with the selected window.

9. (Original) A display device as claimed in claim 8, said association means comprising discrimination means for discriminating signals receiving from said at least two remote controls so as to determine from which remote control the received signals originate.

10. (Previously Presented) A television receiver as a display device as claimed in claim 8.

11. (Currently Amended) A remote control for use in a display system ~~as claimed in Claim 1~~, wherein the remote control comprises association means for associating the remote control with a respective window of a display device having window selection means which are adapted to select said respective window in response to a parameter control command received from the remote control, the display device further comprising control means adapted to control a parameter of said respective window in accordance with said parameter control command.

12. (Original) A remote control as claimed in claim 11, said association means comprising window identification means for transmitting, along with a transmitted parameter control command, a signal indicative of a window associated with the remote control.

13. (Original) A remote control as claimed in claim 11, said association means comprising remote control identification means for transmitting, along with a transmitted parameter control command, a signal identifying the remote control.

14. (Currently Amended) A method of controlling a multi-window display system, comprising:

a step of user operably selecting one of a plurality of windows in a display screen,

a step of controlling a parameter of said selected window in response to a user supplied parameter control command, characterized in that the method further comprises:

a step of associating a respective one of at least two remote controls with a respective window, and

a step of selecting the window in response to a parameter control command received from a remote control associated with the selected window, the parameter control command comprising window identification information.

15. (New) The method of Claim 14, wherein the display system is capable of receiving information from different sources and displaying the information from each of the sources in the windows.

16. (New) The method of Claim 14, wherein each of the remote controls is capable of transmitting a signal identifying the window associated with the remote control.

17. (New) The method of Claim 14, further comprising receiving signals from a plurality of the remote controls and identifying from which remote control each of the received signals originated.

18. (New) The method of Claim 17, wherein at least two of the remote controls are capable of transmitting signals using different protocols.

19. (New) The method of Claim 14, wherein each of the remote controls is capable of transmitting a signal identifying the remote control.

20. (New) A display system, comprising:  
a display screen capable of displaying information in at least two windows;  
a parameter controller capable of controlling one or more parameters of the windows;  
an associator capable of associating one of at least two remote controls with a respective window; and

a window selector capable of selecting a window in the display screen to be controlled by the parameter controller, wherein the window selector is capable of selecting the window in response to a parameter control command received from the remote control associated with the selected window.
